Agenda

1. Introduction / Questions to answer
2. Software Requirements
3. Data Sources
4. Data Model
5. Data Flow
6. Data Preprocessing
7. Data Generation
8. Initial Load, Incremental Load, and SCD
9. OLAP Cube
10. Visualizations
11. Answers to Questions

1. Introduction

Nowadays the population is increasing day by day, use of energy sources and pollution is also increasing rapidly which affects weather as well. We U.S. decided to build a warehouse with respective fields for more effective analysis on how energy source generation and consumption is affected by population, pollution, and weather in the

2. Software Requirement

- SSIS : ETL & Data Warehouse
- SSAS: OLAP Cube
- Tableau: Visualization

3. Data Sources

4. Data Model

1. In our data warehouse, the fact table is “FactElectric” which stores facts about electric power consumption and generation.
2. The dimension tables are “DimFacility”, “DimPopulation”, “DimPollution”, and “DimWeather”.
3. We choose state and year as our dimensions for the OLAP Cube and NO2Mean, NO2AQI, O3Mean, O3AQI, COMean, COAQL, SO2Mean, SO2AQI, AvgTemp, MaxTemp, MinTemp, ElecFuelConsumptionMmbtus, NetGenerationMegawatthours etc as our measures. This was all done to see the trends in the data we used.

5. Data Flow

- 2010-2016 for the Initial Load and 2017 for the Incremental Load
- SCD is on the Facility dimension (DimFacility)
 - FacilityName, OperatorID, OperatorName, NaicsCode

6. Data Preprocessing

Electric Power Data

- Remove the first 5~7 rows
- Remove the aggregated records (at state/fuel type level) for the FacilityName="State-Fuel Level Increment" & FacilityID=99999
- Rename column names
- Replace "." values with an appropriate year for the Year column
- Done in Python

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q		
1	U.S. Department of Energy				This file contains the final 2010 data. During the year, the EIA-923 survey collected monthly data from approximately 1900 generating plants. These data were published each month as preliminary and subject to revision. The remaining out-of-sample power plants reported data annually. In this final 2010 database, the annual responses are proportionately distributed over the months using the ratio of collected monthly data to the sum of that monthly data. The entire set of data collected for 2010 is now final and shown below with plant-specific names and plant numbers. Plants that did not respond or data that could not be verified are estimated. The estimates are rolled-into state/fuel aggregates with a "99999" plant code. For additional information, see the documentation file on page 6 of this workbook.

6. Data Preprocessing

Air Pollution Data

- Put double quotes around non-numeric values/columns
 - Issue: Columns are separated by a comma, and values are not quoted in the original data files. However, some records contain a comma in their Address column.
- Done in Python
- Specify a double quote “ for the Text Qualifier in Flat File Source in SSIS

7. Data Generation

Initial Load - Weather Data

- Found only the 2015 data for all states in the U.S.
- Generate 2010-2014 and 2016 data for initial load and 2017 data for incremental load
- Add random values between -3 and 3 to the AvgTemp, MaxTemp, and MinTemp from 2015 data

7. Data Generation

2017 Incremental Load

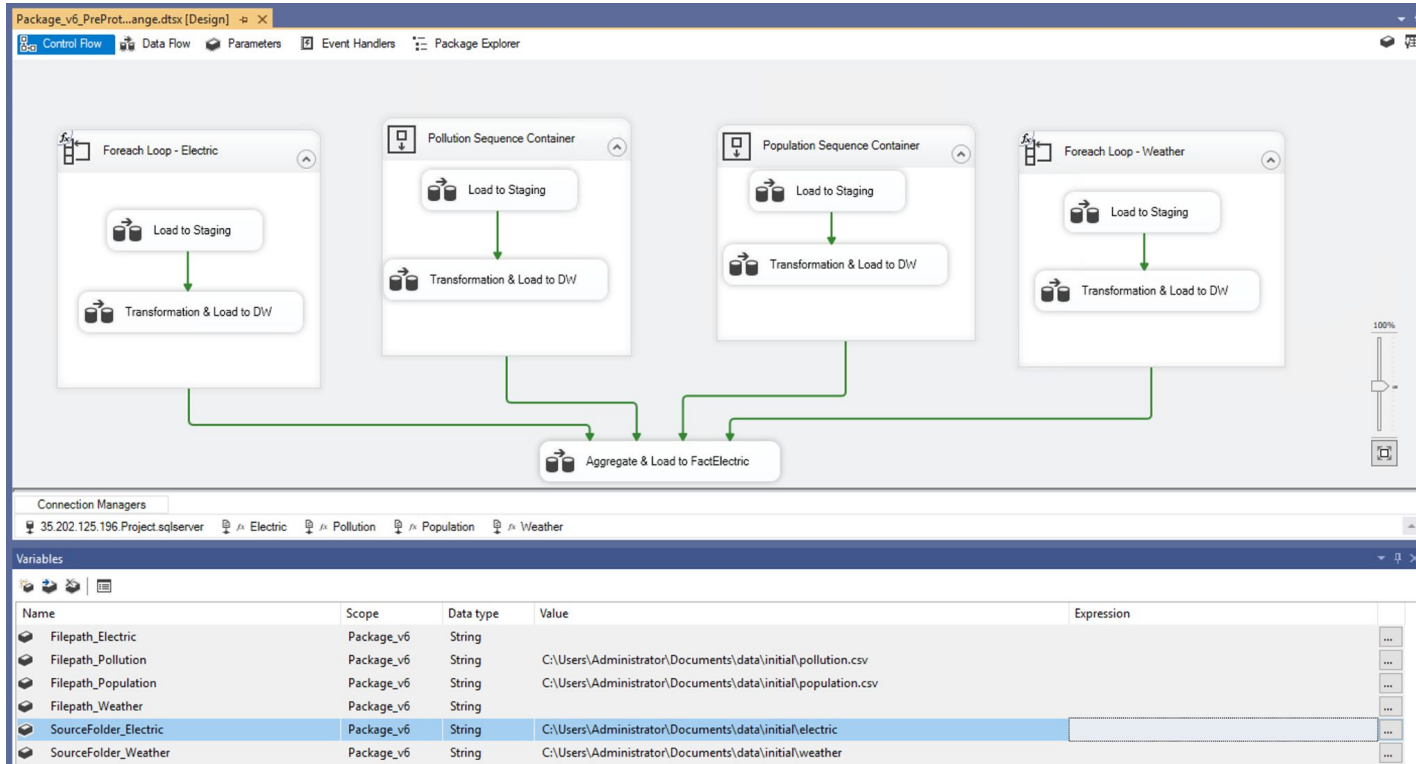

- Weather Data
- Air Pollution Data
 - Add random values between 0 and 1 to NO2Mean, NO2AQI, O3Mean, O3AQI, SO2Mean, SO2AQI, COMean, COAQI from 2016 data
- 2017 Electric Power Data and 2017 Population Data are provided from the original data sources.

7. Data Generation

Slowly Changing Dimension (SCD)

- DimFacility
 - FacilityName : Type 2
 - OperatorID: Type 1
 - OperatorName & NaicsCode: Type 3
- There are already value changes on these columns as we load data from 2010 to 2017
- For the testing purpose, selected and modified 5 records from the 2017 Electric Power Data

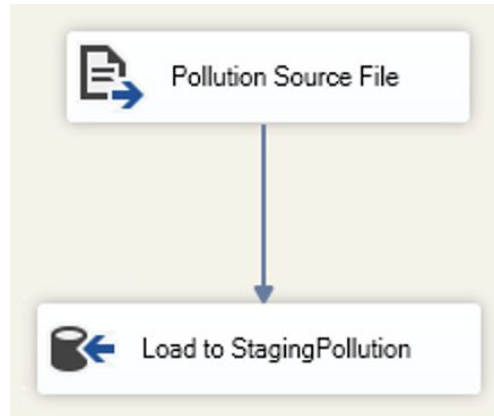

8. Initial Load, Incremental Load, and SCD

9. Storing the Data in OLAP System (SSAS)

Creating the dimensions for DimPollution and DimPopulation.

The image displays two side-by-side screenshots of the SQL Server Enterprise Manager interface, specifically the 'Data Source View' and 'Attributes' panes, illustrating the creation of two dimensions: DimPollution and DimPopulation.

Left Pane (DimPollution):

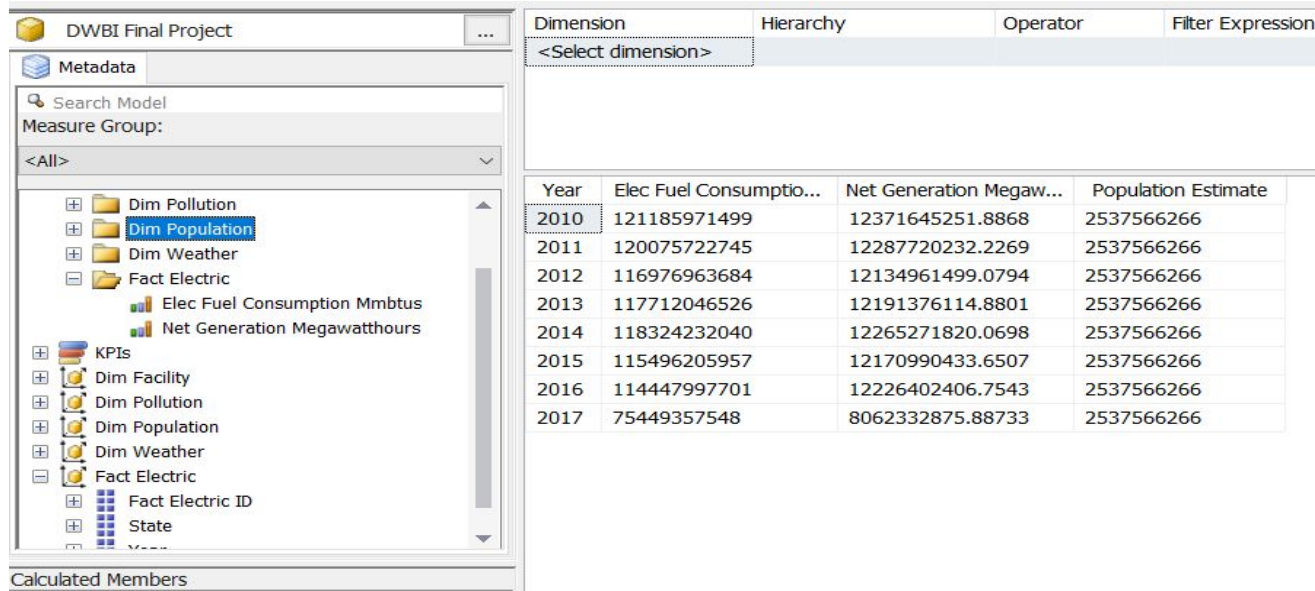

- Data Source View:** Shows a list of attributes for the DimPollution dimension. The attributes are: DimPollutionID (marked with a key icon), Year, State, NO2Mean, NO2AQI, O3Mean, O3AQI, SO2Mean, SO2AQI, COMean, and COAQI.
- Attributes:** Shows the 'Dim Pollution' dimension selected. The attributes listed are: Dim Pollution ID (marked with a key icon), State, and Year.

Right Pane (DimPopulation):

- Data Source View:** Shows a list of attributes for the DimPopulation dimension. The attributes are: DimPopulationID (marked with a key icon), Year, State, PopulationEstimate, NumericPopulationChange, Births, Deaths, and NetMigration.
- Attributes:** Shows the 'Dim Population' dimension selected. The attributes listed are: Dim Population ID (marked with a key icon), State, and Year.

9. Storing the Data in OLAP System (SSAS)

Building, processing and deploying the Cube with the dimensions created.

The screenshot displays the SQL Server Data Tools (SSDT) interface for a cube named 'DWBI Final Project'. The left pane shows the 'Metadata' tab with a tree view of dimensions and facts. The right pane shows a table of data for the 'Population Estimate' dimension.

Metadata Tree View:

- Dim Pollution
- Dim Population
- Dim Weather
- Fact Electric
 - Elec Fuel Consumption Mmbtus
 - Net Generation Megawatthours
- KPIs
 - Dim Facility
 - Dim Pollution
 - Dim Population
 - Dim Weather

10. Visualization

1. Electricity generation v/s Consumption

2. Fuel Consumption for electricity generation VS Temperature

3. Population VS Net generation

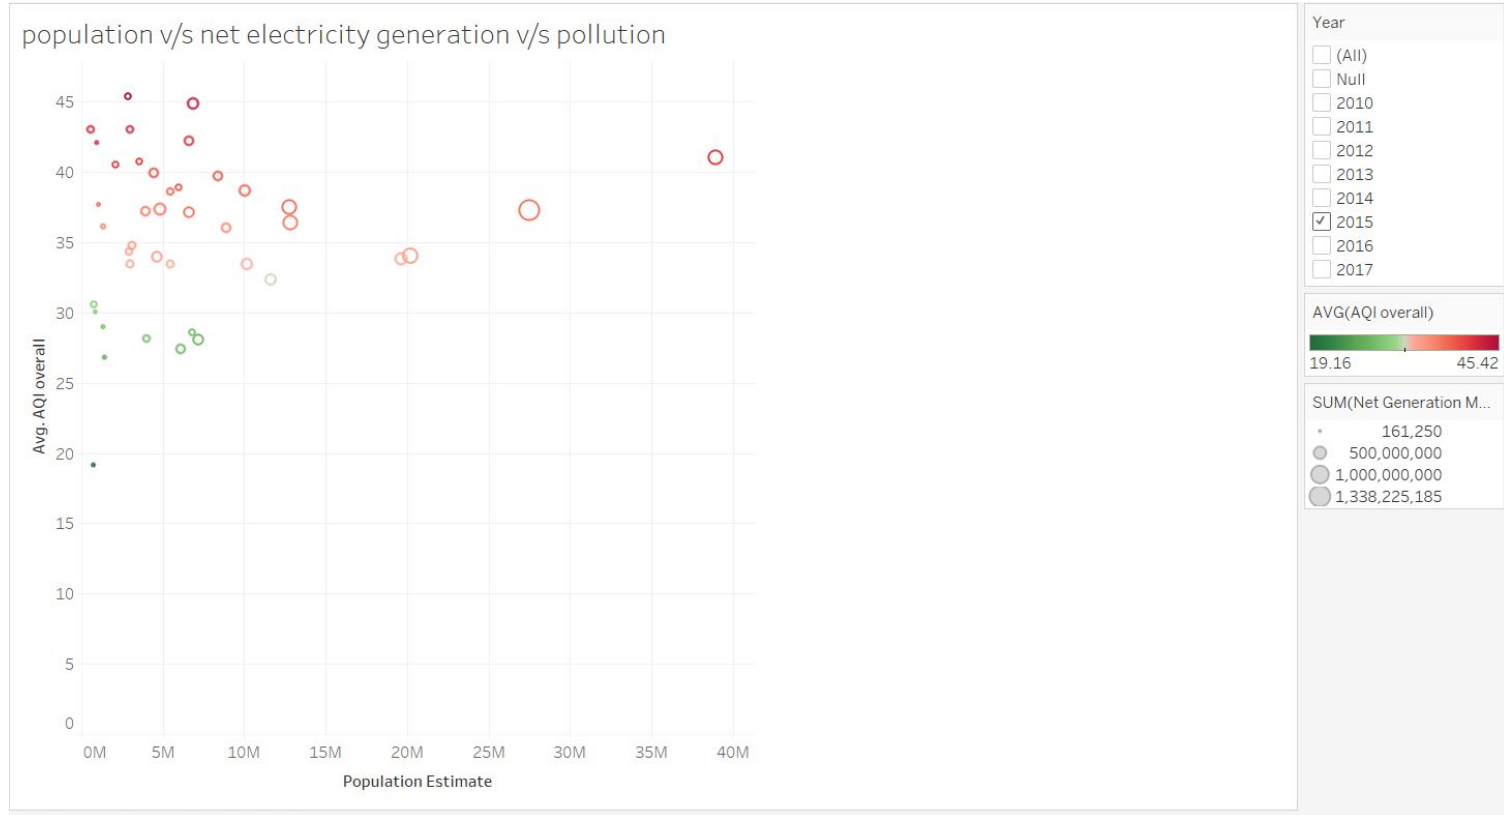

4. Air Quality Analysis

5. Pollution VS Temperature

6. Correlation between pollution, population and fuel consumption

7. Population V/S Electricity generation

11. Answers to Questions

1. What kind of relationship/impact does Electric Power generation and fuel consumption have with various pollutions?
2. What kind of relationship/impact does Population have on Electric Power generation and fuel consumption?
3. What kind of relationship/impact does Temperature have on Electric Power generation and fuel consumption?
